

Adding New Lectures & Folders

Quick reference for updating the 2-2 Lecture Notes site (`buet-2-2-notes.vercel.app`)

The site is one folder on your computer (`D:\BUET Files\2-2\HTMLS`) plus one file, `index.html`, that builds the sidebar menu from a list called `courses` near the bottom of that file. Every time you add a page, you do two things: drop the file on disk, and add one entry to that list. Nothing appears on the live site until you redeploy.

A. Add a new lecture to an existing folder

1. Save the file

Put the new `.html` file inside the matching course folder, for example:

```
D:\BUET Files\2-2\HTMLS\CSE209\NewLecture.html
```

2. Open `index.html` and find the course

Open `index.html` in a text editor and scroll to the `const courses = [ ... ]` block. Find the object whose name matches your folder, e.g. `"CSE209"`.

3. Add one entry to its `items` array

Add a new line inside that course's `items: [ ... ]` list:

- ```
 { file: "CSE209/NewLecture.html", title: "Lecture 07: Whatever Topic" },
```
- `file` — the folder name + `/` + exact file name, matching what is on disk (capitalization and spaces included).
  - `title` — the text shown in the sidebar menu; this can be anything readable.
  - Put a comma after the previous entry's closing `}` if yours isn't the last one in the list.

### 4. Redeploy

Save the file, then run this from the project folder:

```
cd "D:\BUET Files\2-2\HTMLS"
vercel --prod --yes
```

Refresh `https://buet-2-2-notes.vercel.app` and the new lecture will be in the menu.

## B. Create a brand-new folder (a new course)

### 1. Create the folder

Make a new folder directly inside `D:\BUET Files\2-2\HTMLS`, named after the course, e.g. `CSE305`. Spaces are allowed if that matches your naming style, but a plain name is easiest.

### 2. Add your lecture files

Put one or more `.html` files inside the new folder.

### 3. Add a new course block

In `index.html`, add a new object to the end of the `courses` array (just before the closing `];`):

```
{
 name: "CSE305",
 items: [
 { file: "CSE305/lecture1.html", title: "Lecture 1: Topic Name" },
 { file: "CSE305/lecture2.html", title: "Lecture 2: Topic Name" }
]
},
```

Remember the comma after the previous course's closing `}`, right before your new one.

### 4. Redeploy

Same command as before:

```
cd "D:\BUET Files\2-2\HTMLS"
vercel --prod --yes
```

The new course appears as its own collapsible section in the sidebar.

## C. Tips & common mistakes

- **Nothing shows up after redeploying** — almost always a missing comma or bracket in the `courses` array. A single syntax error breaks the entire menu, not just the new entry.
- **Page won't load / blank content pane** — double check the `file` path exactly matches the folder and file name on disk, including capitalization.
- **Spaces in folder/file names are fine** — the menu automatically encodes them; you don't need to type `%20` yourself.
- **Always use forward slashes (/) in the file path**, never backslashes, even though Windows paths use backslashes.
- **Changes are local until you redeploy** — editing files and saving them does nothing to the live site until `vercel --prod --yes` runs successfully.

---

Quick redeploy command (memorize this one):

```
cd "D:\BUET Files\2-2\HTMLS"
vercel --prod --yes
```
